设计思路

参考了: https://blog.csdn.net/xuedingkai/article/details/78997928

该作者的思路是Map用于取input的每一行,组合user和其任一好友为key(key中的两个字段按字典序排列),user的所有好友为value,Reduce用于求两个用户之间好友的交集。

但发现该代码与题目要求有所出入,题目要求任意两人的共同好友,该代码求的是好友间的共同好友。

比如:

```
100, 200 300 400
200, 100 400
300, 100
400, 100
```

按照原文的代码,结果是:

```
[100,200],[300]
[200,400],[100]
```

但按照题目要求,结果应该是:

```
[100,200],[300]
[200,300],[100]
[200,400],[100]
[300,400],[100]
```

基于上次两个job的经验,这次我也在原有基础上加了一个Map和Reduce,用于取每一个user的ID,将第二个Map中user与其好友组合的步骤,替换为user和其他所有人组合,代码就不在这里展示了。

代码结果

```
cf_HW6 > CommFriends > output2 > ≡ part-r-00000
      [100, 200], [300, 400]
      [100, 300],
                     [200, 400, 500]
                    [200, 300]
      [100, 400],
                     [300]
      [100, 500],
      [200, 300],
                      [100, 400]
                      [100, 300]
      [200, 400],
      [200, 500],
                      [100, 300]
      [200, 600],
                      [100]
      [300, 400],
                      [100, 200]
      [300, 500],
                      [100]
      [300, 600],
                      [100]
      [400, 500],
                      [100, 300]
      [400, 600],
                      [100]
                      [100]
      [500, 600],
```

运行截图

```
PROBLEMS 7 OUTPUT DEBUGCONSOLE TERMINAL

```

遇到的问题及解决方案

总体比较顺利没遇到什么大问题,只是作为一个强迫症看到下面的Warning很不爽:

```
cf_HW6 > CommFriends > src > main > java > nju > ② CommFriends.java > % CommFriends

private static String outputPath2 = "hdfs://localhost:9000/user/sheepxi/output2";

Run | Debug
public static void main(String[] args) throws IOException, ClassNotFoundException, I

Configuration conf = new Configuration();

Job job1 = new Job(conf, "all users");

job1.setJarByClass(commFriends.class);

job1.setMapperClass(MyMapper0.class);

job1.setMapputputKeyClass(Text.class);

job1.setMapOutputKeyClass(Text.class);

job1.setOutputKeyClass(Text.class);

job1.setOutputKeyClass(Text.class);

FileSystem fs1 = FileSystem.get(conf);

Path inPath1 = new Path(inputPath);

if (fs1.exists(inPath1)) {

FileInputFormat.addInputPath(job1, inPath1);
```

就在前面加了一行注解:

```
@SuppressWarnings("deprecation")
```

另外还有output删起来很麻烦的问题,用下图的方式在main里把它删掉了:

```
FileSystem fs1 = FileSystem.get(conf);
Path inPath1 = new Path(inputPath);
if (fs1.exists(inPath1)) {
    FileInputFormat.addInputPath(job1, inPath1);
}
Path outPath1 = new Path(outputPath);
[fs1.delete(outPath1, true);
FileOutputFormat.setOutputPath(job1, outPath1);
```
